Dear user:

Thank you for choosing and using our products. For your better understanding and use of this product, be sure to read and comply with the following matters before use

IMPORTANT NOTICE

Signal words (danger, warning and caution) are used to identify levels of hazard seriousness. Definitions for identifying hazard levels are provided below with their respective signal words:

DANGER : A hazardous situation which, if not avoided, should result in death or serious injury.

WARNING : A hazardous situation which, if not avoided, could result in death or serious injury.

CAUTION : Used with the safety alert symbol, indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTE :Useful information for operation and/or maintenance.

- This manual should be considered as a permanent part of the air conditioning equipment and should remain with the air conditioning equipment.
- This manual gives a common description and information for this heat pump air conditioner which you operate as well for other models.
- HISENSE pursues a policy of continuing improvement in design and performance of products. The right is therefore reserved to vary specifications without notice.
- HISENSE cannot anticipate every possible circumstance that might involve a potential hazard. This heat pump air conditioner is designed for standard air conditioning only. Do not use this heat pump air conditioner for other purpose such as drying clothes, refrigerating foods or for any other cooling or heating process. Do not install the unit in the following places. It may cause a fire, deformation, corrosion or failure.
  - * Places where oil (including machinery oil) sprays
  - * Places where inflammable gas may generate or flow.
  - * Places where a lot of sulfide gas drifts such as in hot spring.
  - * Places where strong salty wind blows such as coast regions , or places with an atmosphere of acidity or alkalinity.
- Do not install the unit in the place where silicon gas drifts. If the silicon gas attaches to the surface of heat exchanger, the fin surface repels water. As a result, drain water splashes outside of the drain pan and splashed water runs inside of electrical box. In the end, water leakage or electrical devices failure may occur.
- Do not install the unit in the place where the breeze directly catches the animals and plants. It could adversely affect the animals and plants.
- Installation and service engineering must comply with local standards, laws and regulations.
- As the"public inaccessible appliances", the indoor units are required to be installed at a height of no lower than 2.5m.
- The installation of the air conditioner can only be carried out by dealer or professional, and self installation by user may cause water leakage, electric shock or fire.
- If you have any questions, contact your dealer or designated service center of HISENSE.
- To prevent the environment, please do not discard the product at will, and HISENSE can provide recycling services in accordance with the relevant provisions of the country and provide replaceable parts in accordance with national standard requirements.
- This heat pump air conditioner has been designed for the following temperatures. Operate the heat pump air conditioner within this range.

⚠ DANGER

- Do not perform installation work, refrigerant piping work, drain pump, drain piping and electrical wiring connection without referring to our installation manual. If the instructions are not followed, it may result in a water leakage, electric shock or a fire. In case of fire, cut off the power at the first time; do not touch the electrical parts by hand to avoid electric shock hazard.
- Do not pour water into the indoor or outdoor unit. These products are equipped with electrical parts. If poured, it will cause a serious electrical failure.
- Do not open the service cover of the indoor or outdoor units without turning OFF the main power supply, otherwise it may cause a serious safety accident.
- Do not touch or adjust safety devices inside the indoor unit or outdoor units. If these devices are touched or readjusted, it may cause a serious accident.
- Refrigerant R410A for this unit is incombustible, non-toxic and odorless; however if the refrigerant is leaked and is contacted with fire, toxic gas will generate. Also because the R410A is heavier than air, the floor surface will be filled with it, which could cause difficulty with breathing due to insufficient air. Turn OFF the main switch, extinguish any naked flames and contact your service contractor, if refrigerant leakage occurs. Do not charge oxygen, acetylene or other flammable and poisonous gases into the refrigeration cycle when performing a leakage test or an air-tight test. These types of gases can cause an explosion. It is recommended that nitrogen be used for these types of tests.
- Refrigerant safety leakage standards for construction and operation systems are determined in accordance with local regulations or standards
- Use an ELB (Earth Leakage Breaker,with an actuation time of 0.1 second or less) at or above medium induction speed, otherwise it may cause an electric shock or a fire.
- For installation, firmly connect the refrigerant pipe before the compressor starts operating.
- For maintenance, relocation and disposal, remove the refrigerant pipe after the compressor stops.
- Do not perform a short-circuit of the protection device such as a pressure switch when operating. It may cause a fire and explosion.

▲ WARNING

- Do not use any sprays such as insecticide, lacquer, hair spray or other flammable gases within approximately one (1) meter from the system.
- If circuit breaker is often activated, stop the system and contact your or service contractor.
  Check that the ground wire is securely connected. If the unit is not correctly grounded, it leads electric shock. Do not connect the ground wiring to gas piping, water piping, lighting conductor or ground wiring for telephone.
- Before performing any brazing work, check to ensure that there is no flammable material around. When filling refrigerant be sure to wear leather gloves to prevent cold injuries.
- Protect the wires, electrical parts, etc. from rats or other small animals. If not protected, rats may gnaw at unprotected parts and which may lead to a fire.
- Fix the cables securely. External forces on the terminals could lead to a fire.
- Provide a sufficiently strong foundation. If not, the unit may fall down and it may lead to injuries.
- Perform electrical work according to Installation Manual and all the relevant regulation and standards.
- If the instructions are not followed, an electrical failure and fire may occur due to insufficient capacity and inadequate performance.
- Use specified cables between units and choose the cables correctly. If not, an electrical failure or fire may occur.
- Ensure that the outdoor unit is not covered with ice and snow before use.
- This appliance can be used by children aged from 8 years and above and persons with reduced physical, sensory or mental capabilities or lack of experience and knowledge if they have been given supervision or instruction concerning use of the appliance in a safe way and understand the hazards involved. Children shall not play with the appliance. Cleaning and user maintenance shall not be made by children without supervision.
- The A-weighted emission sound pressure level at workstations does not exceed 70 dB(A).

⚠ CAUTION

- Do not step on or put any material on the product.
- Do not put any foreign material on the unit or inside the unit.
- Do not install the indoor unit, outdoor unit, remote control switch and cable within approximately 3 meters from strong electromagnetic wave radiators such as medical equipment.
- Starting the unit after longtime idleness requires the compressor temperature to meet the starting requirements or reach a certain heating time.

NOTE:

- It is recommended that the room will be ventilated every 3 to 4 hours.
- In some cases, the heat pump air conditioner may not be operated normally under the following cases.
  - * In case that the power supplied by the power transformer is less than or equal to the electric power of the air conditioner.
  - * In case that the large power-consuming equipment is too close to the power supply wiring for the air conditioner, so that large surge voltage may be inducted in the power supply wiring of the air conditioner.
- The heating capacity of the heat pump unit is decreased according to the outdoor air temperature. Therefore, it is recommended that auxiliary equipment be used in the field when the unit is installed in a low temperature region.
- The repair and maintenance of this air conditioner can only be carried out by professional .

○ Available

- The number of connectable indoor units with the outdoor unit is as follows. Comply with the condition as follows when installing the unit.
- A maximum total capacity of 150% and a minimum total capacity of 50% can be obtained by combination of the indoor units when compared with the nominal outdoor unit capacity.

1.3 Combination (High Efficiency Type)

Utilizing an inverter control, a wide range of operation capacity control is also available. A maximum total combination horsepower of 150% and a minimum total combination horsepower of 50% can be chosen by combination of the indoor units when compared with the nominal outdoor unit capacity. Therefore, the new system can meet individual air conditioning requirements in most office buildings.

NOTE:

1. In a system where all indoor units operate at the same time and the same mode, total capacity of these indoor units should not be larger than combined capacity of the outdoor units, or otherwise overload may occur under severe working condition or within narrow operating range.

2. If the system is used in the cold area (ambient temperature becomes under -10°C) or under the high heating load conditions, the total indoor unit capacity should be less than 100% against the outdoor unit and total piping length is less than 300m.

3. 05/07 type indoor units are set with higher air flow. Determine the working environment and installation location carefully. Do not install these units in the place where the cold draft may occur during heating operation. If the unit is installed in such places, the number of connectable I.U. should be less than the recommended number on the table above.

4. When the connected indoor units contain Cassette Type or Wall-Mounted Type,and the nominal capacity is less than or equal to 12kBth/h, the total indoor unit capacity should be equal to or less than 130% against the outdoor unit.

5. When the outdoor air temperature is more than 43℃ during the cooling operation, the total indoor unit capacity should be equal to or less than 100% against the outdoor unit.

6. If the operational capacity of indoor units at the same mode is more than 130% against the outdoor unit, the indoor units should be set to low airflow operation.

NOTE：

(1) Check the gas pipe and liquid pipe are equivalent in terms of the piping length and piping system.

(2) Piping length between outdoor units should be La⩽Lb⩽Lc⩽Ld⩽10m.

(3) If the piping length between some branch and indoor unit (L3) is considerably longer than others, refrigerant may not flow well and also performance may be deteriorated compared to other models. (Recommended: L3⩽15m)

(4) When the liquid piping length is longer than 15m, use Φ9.53 pipe and reducer (field-supplied).

(5) Allowable total piping length may become shorter than 1,000m due to the limitation of maximum additional refrigerant amount.

(6) Fuction setting of Ci is required (Ci=2), in case of height difference between indoor units: 15m ＜ H2 ⩽30m.

(7) In case of the height difference between outdoor units and indoor units: 50 m(40m) ＜ H1 ⩽90m, contact technical department of the manufacture.

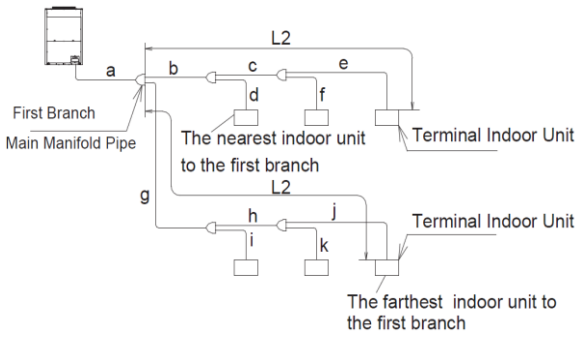
Piping Branch Restrictions

In the case that the piping length from the first branch to the farthest indoor unit (L2) is over 40m, follow the instructions below when performing the field-supplied piping work.

Example 1: Installation with Main Piping Branch
In the case that piping length from the first branch to the terminal indoor units is within 40-90m.

(1) If the piping length L2 is over 40m, the diameter of gas and liquid lines “b and c” or “g and h” should be increased by one size with reducers (field-supplied).
(2) The difference between the piping length from the first branch to the farthest indoor unit and the piping length from the first branch to the nearest indoor unit must be within 40m.



Example 2: Installation without Main Piping Branch
In the case that piping length from the first branch to the terminal Indoor Units is within 40-90m,

(1) If the piping length L2 is over 40m, the diameter size of gas and liquid lines “b, d and f” should be increased by one size with reducers (field-supplied). If (a) is smaller than (b) after increasing the size, increase the size of (a) to the same size as (b).
(2) The difference between the piping length from the first branch to the farthest indoor unit and the piping length from the first branch to the nearest indoor unit must be within 40m.

1.9 Capacity Characteristic

1.9.1 Cooling Capacity at Different Temperatures

Please refer the following tables for cooling capacities, in which:

Q: Total Capacity
P: Input Power
To: Outdoor temperature, unit: ℃, dry bulb
Ti: Indoor temperature, unit: ℃, wet bulb

NOTE:

1. The table shows the reference value of a cooling operation. This will change depends on the installation. In some cases, the value may change due to the compressor protection control.

2. The value on the table shows when the system is operated under the following conditions: total piping length:7.5m, height difference: 0m

3. In an instance of a heat recovery system, the value on the table indicates when all the indoor units are operated in cooling mode.

1.9.2 Heating Capacity at Different Temperatures

Please refer the following tables for heating capacities, in which:

Q: Total Capacity
P: Input Power
To: Outdoor temperature, unit: ℃, wet bulb
Ti: Indoor temperature, unit: ℃, dry bulb

NOTE:

1. The table shows the reference value of a heating operation. This will change depends on the installation. In some cases, the value may change due to the compressor protection control.
2. The heating capacity on the table indicates the peak value, which does not include the capacity decrease caused by frost.
3. The value on the table shows when the system is operated under the following conditions:
total piping length: 7.5m, height difference: 0m
4. In an instance of a heat recovery system, the value on the table indicates when all the indoor units are operated in heating mode.

1.10 Capacity Correction Based on Refrigerant Piping Length

< Cooling Capacity >

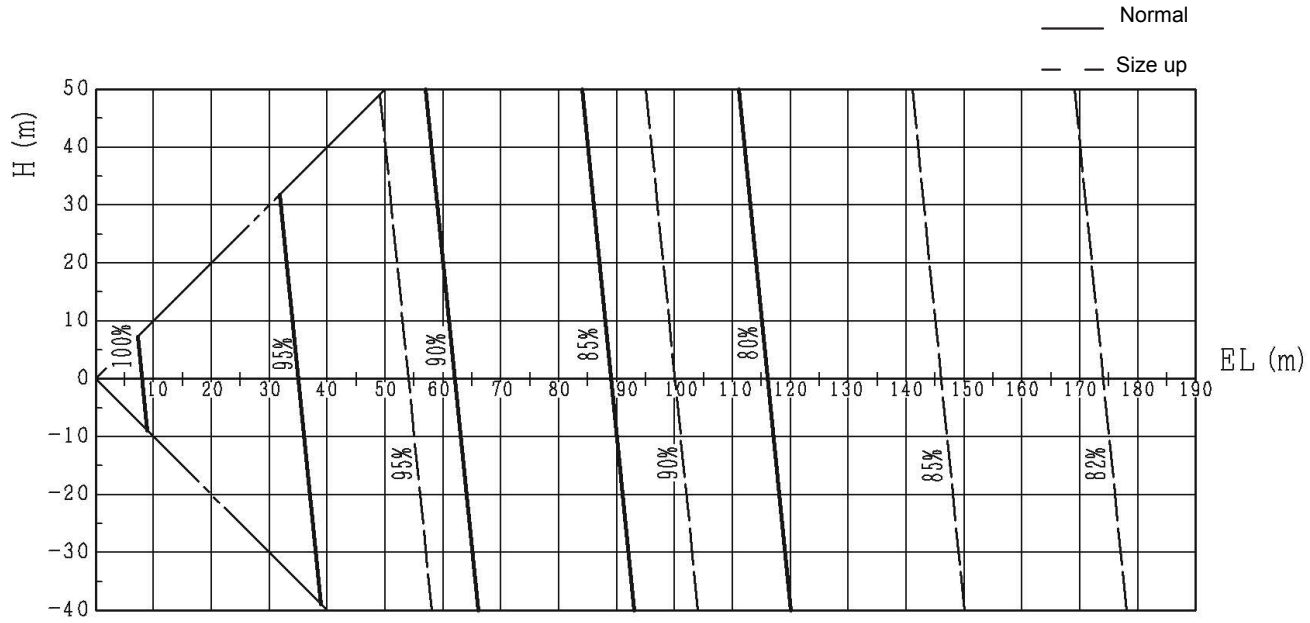
The cooling capacity should be corrected according to the following formula:

CCA=CC×F
CCA: actual corrected cooling capacity
CC: cooling capacity in the performance table
F: correction factor based on the equivalent piping length

The correction factors are shown in the following figure.

Equivalent Piping Length for
- one 90° elbow is 0.5m.
- one 180° bend is 1.5m.
- one branch pipe is 0.5m.

AVWT-76*~848*



<Heating Capacity >

Correction factor for cooling capacity according to piping length.

The heating capacity should be corrected according to the following formula:

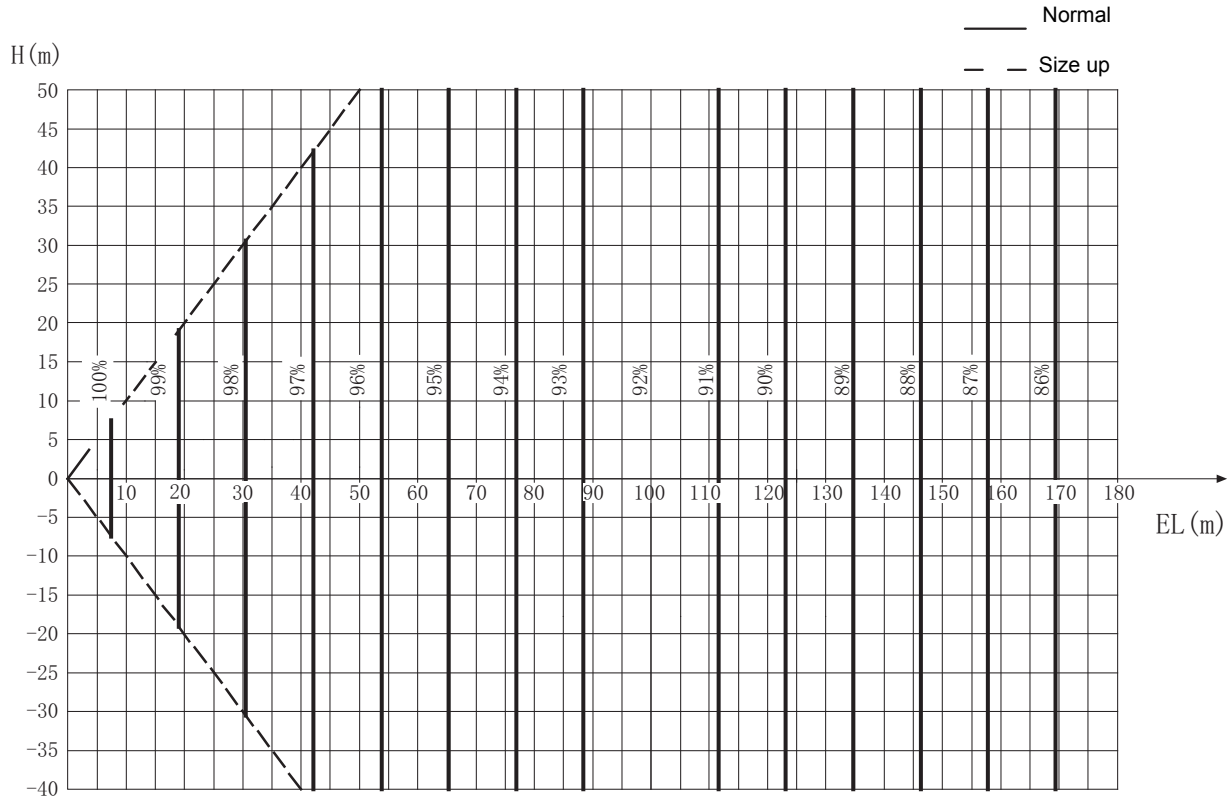
HCA=HC×F
HCA: actual corrected cooling capacity
HC: cooling capacity in the performance table
F: correction factor based on the equivalent piping length

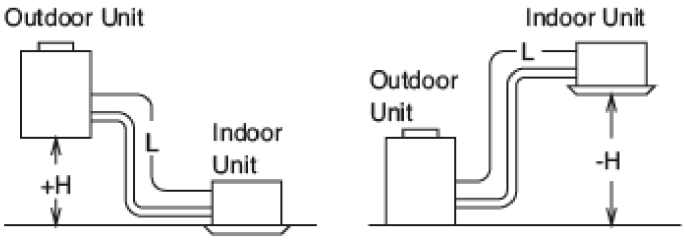
The correction factors are shown in the following figure.

Equivalent Piping Length for

- one 90° elbow is 0.5m.
- one 180° bend is 1.5m.
- one branch pipe is 0.5m.

AVWT-76*~848*





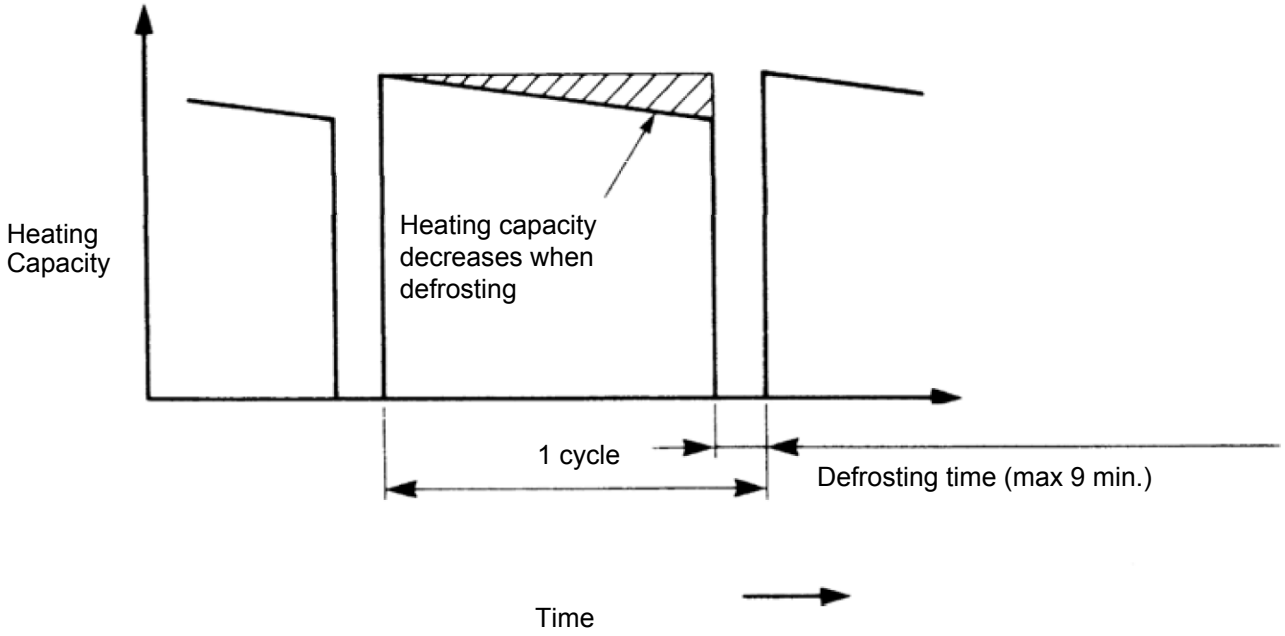
H: vertical distance between indoor unit and outdoor unit in meters
EL: equivalent total distance between indoor unit and outdoor unit in meters (equivalent one-way piping length)
H>0: position of outdoor unit higher than position of Indoor unit
L: actual one-way piping length between indoor unit and outdoor unit in meters

1.11 Correction Factor According to Defrosting Operation

The heating capacity in the preceding paragraph excludes the condition of the frost or the defrosting operation period.

In consideration of the frost or the defrosting operation, the heating capacity is corrected by the equation below.
Corrected Heating Capacity = Correction Factor × Heating Capacity

Outdoor Inlet Air Temp. (℃ DB) (Humidity=85% RH)	-7	-5	-3	0	3	5	7
Correction Factor	0.95	0.93	0.88	0.85	0.87	0.90	1.0



NOTE:
The correction factor is not available for the special condition like a snowfall or an operation in a transitional period.

INSTALLATION

1. Structure

1.1 Outdoor Unit & Refrigeration Cycle

Regarding structure drawings and refrigeration cycle diagram, please refer to 1.7 and 1.12.1 in DESIGN chapter.

1.2 Necessary Tools and Instrument List for Installation

Check the design pressure for this product is 4.15MPa.
To avoid accidental mixing of the different refrigerant or different refrigerant oil, the sizes of the charging connections have been changed. It is necessary to prepare the following tools before performing the installation work.

No.	Tool	No.	Tool	No.	Tool	No.	Tool
1	Handsaw	6	Copper Pipe Bender	11	Spanner	16	Leveller
2	Phillips Screwdriver	7	Plier	12	Charging Cylinder	17	Clamper for Solderless Terminals

4	Refrigerant Gas Hose	9	Brazing Kit	14	Cutter for Wires	19	Ammeter
5	Megohmmeter	10	Hexagon Wrench	15	Gas Leak Detector	20	Voltage Meter

NOTE: Use tools and measuring instruments only for the new refrigerant R410A in case of direct contact with the refrigerant.

⚠ DANGER

The pressure of refrigerant R410A is 1.4 times higher than that of conventional refrigerant, impurities such as moisture, oxide film, and grease affect R410A easily. Be sure to remove any moisture, dust, different refrigerant or refrigerant oil from the refrigeration cycle. Therefore, if the specified materials are not used, it may cause explosion, injury, leakage, electric shock or fire.

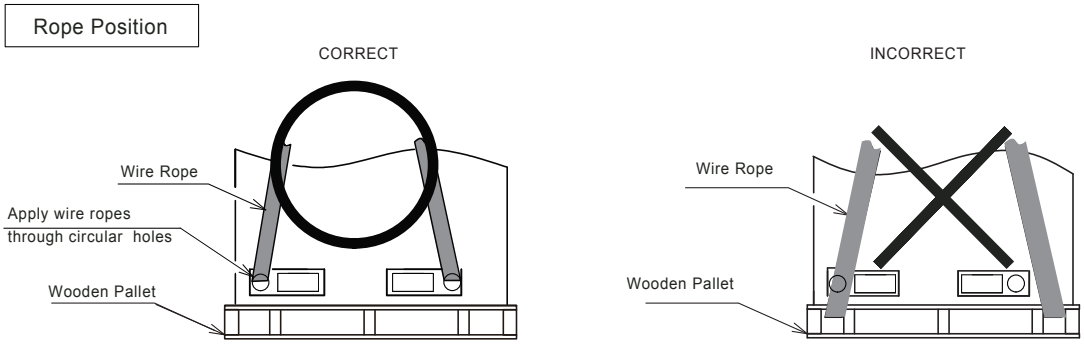
2.1 Transportation

Transport the product as close to the installation location as practical before unpacking. When using a crane, hang the unit according to the description of the label attached to the outdoor unit.

⚠ DANGER

Do not hang the unit by the ropes at the wooden pallet.



⚠ CAUTION

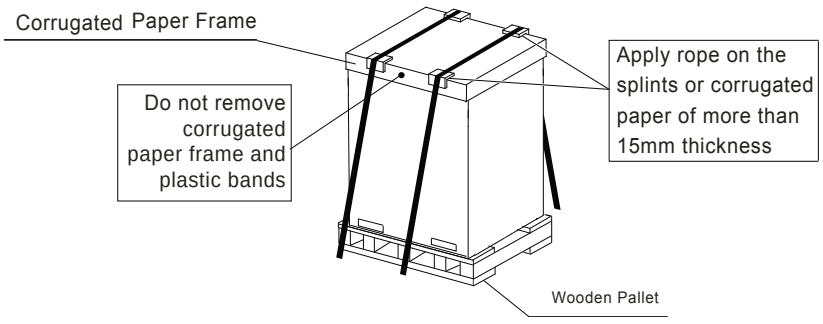
1. Transportation and Storage

The corrugated paper frame is not sufficiently strong, therefore pay attention to the followings in order to prevent the unit from deformation.

- **Do not step on or put any material on the product.**
- **Apply two lifting wires onto the outdoor unit, when lifting it by crane.**
- **Do not stack the product when storing.**

2. Transportation and Wire Rope

- **To protect the unit, do not remove any packing.**
- **Do not stack on or put any material on the product.**
- **Apply wire ropes on the both sides of the unit as shown in the figure.**



2.2 Hanging Method

When hanging the unit, ensure a balance of the unit, check to ensure safety and lift up smoothly.

(1) Do not remove any packing materials.

(2) Hang the unit under packing condition with two (2) wire ropes, as shown in below.

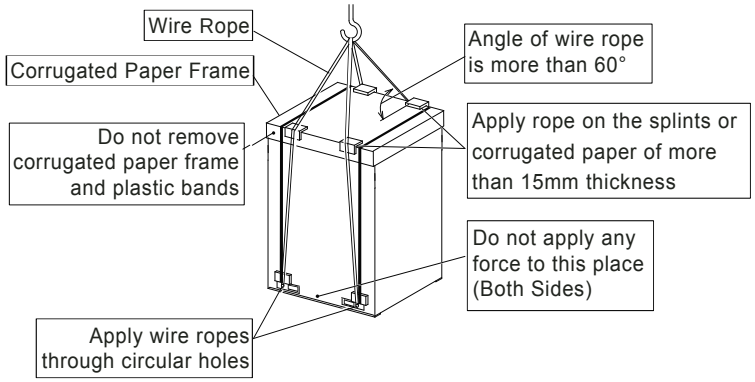


Fig. 2.1 Hanging Work for Transportation

(3) Hang the unit without wooden pallet, as shown in below.

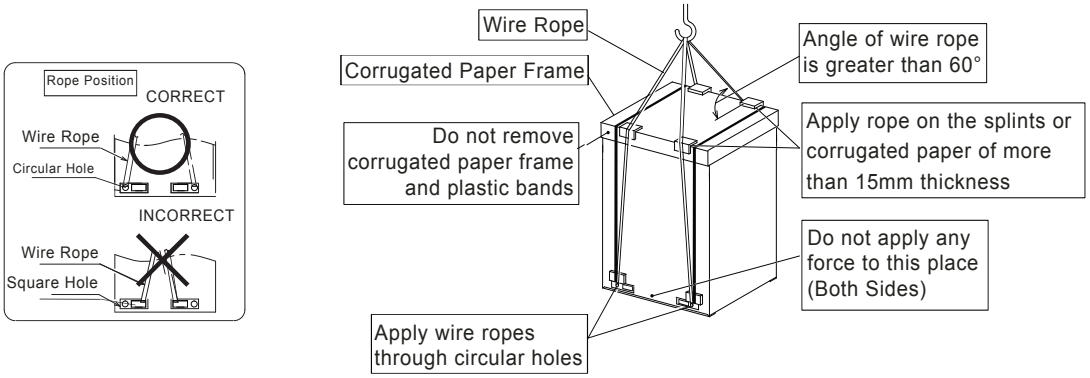

Fig. 2.2 Hanging Work without Wooden Base

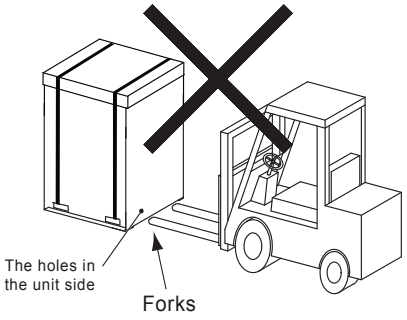
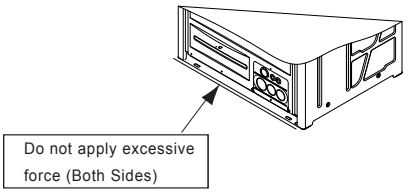
When using forklift, do not insert forks into the holes in the unit side. The unit may be damaged.



Do not apply excessive force to the square holes with forks or other materials. The bottom of the unit may be deformed.

*Do not push the bottom base by fork.
*Do not use roller.



NOTE

In case of transportation after unpacking, protect the unit with splints or cloth.

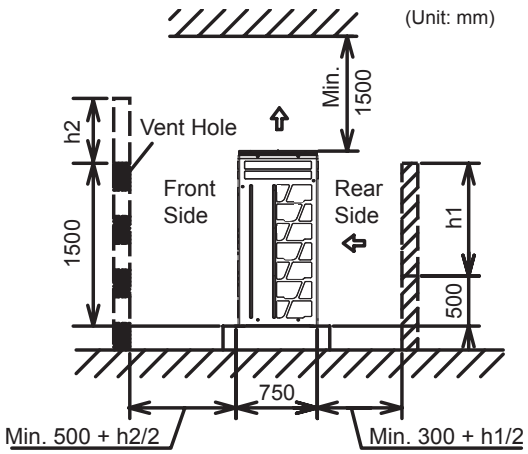
⚠ WARNING

Do not put any foreign material into the outdoor unit and check to ensure that none exists in the outdoor unit before the installation and test run. Otherwise, a fire, failure or personal injury may occur.

3. Outdoor Unit Installation

3.1 Service Space

Make the service space when outdoor unit is installed as follows.



< Side View >

- In case of no walls in front of and at the rear of the unit, the space of 500mm to the front side and 300mm to the rear side is required.
- When the wall of front side is higher than 1,500mm, the space of (500 + h2/2) mm to the front side is required.
- When the wall of rear side is higher than 500mm, the space of (300 + h1/2) mm to the rear side is required.
- When building a wall in front of the unit, make a vent hole in the wall.
- When the space to the obstacle above the unit is less than 1,500mm or the space above the unit is closed, set up the duct at the air outlet side in order to prevent short circuit.
- When there are obstacles above the unit, the four (front, rear, right and left) sides of the unit shall be open in principle.

1) Walls in 2 Directions

In case that the units are installed adjacent to tall buildings and there are no walls in 2 directions, the minimum rear side space is 300mm.

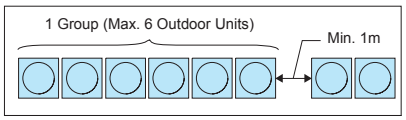
NOTE:

1. Keep the upper side open to prevent mutual interference of inlet and outlet air of each outdoor unit.
2. The dimensions in figure are sufficient spaces around outdoor units for operation and maintenance at typical installing conditions as follows.
   [Operation Mode: Cooling Operation, Outside Temp.: 35oC] In case that the outdoor unit ambient temperature is higher and also the short circuit is likely to occur compared to the installation condition, find an appropriate dimension by calculating air flow current.
3. For the multiple installation, 1 group allows 6 outdoor units (max.).
   The space of 1m between each group is required.



4. Partly open a wall if the unit is surrounded by walls in four directions.

3.2 Factory-Supplied Accessories

Check to ensure that the following accessories are packed with the outdoor unit.

3.3 Installation

(1) Install the outdoor unit in a dry and well ventilated environment.
(2) Install the outdoor unit in the shade or it will not be exposed to direct sunshine or direct radiation from high temperature heat source.
(3) Install the outdoor unit where the sound or the discharge air from the outdoor unit does not affect neighbors or surrounding ventilation.
The operating sound at the rear or right/left sides is 3 to 6dB(A) higher than the nominal value at the front side.
(4) Install the outdoor unit in a space with limited access to general public.
(5) Check to ensure that the foundation is flat, level and sufficiently strong.
(6) Do not install the outdoor unit where dust or other contamination could block the outdoor heat exchanger.
(7) When installing the outdoor unit in snow-covered areas, mount the field-supplied hoods on the top of the outdoor unit and the inlet side of the heat exchanger.
(8) While heating or defrosting operation, drain water is discharged. Provide adequate drainage around the foundation. If installing the unit on a roof or a veranda, avoid draining in or over walkways to prevent water dripping on people or the formation of ice in winter. In case of installing in such a place, provide additional drainage around the foundation.
(9) Do not install the outdoor unit in a space where a seasonal wind directly blows to the outdoor heat exchanger or a wind from a building space directly blows to the outdoor fan.

NOTE:

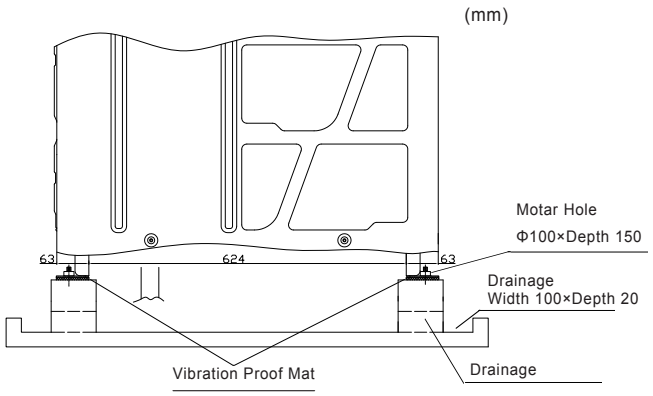
1. Do not install the outdoor unit where there is a high level of oil mist, flammable gases, salty air or harmful gases such as sulphur and an acid or alkaline environment.
2. Do not install the outdoor unit where the electromagnetic wave is directly radiated to the electrical control box. 3. Install the outdoor unit as far as possible, being at least 3 meters from the electromagnetic wave radiator.

3.4 Foundation

●Concrete Foundations

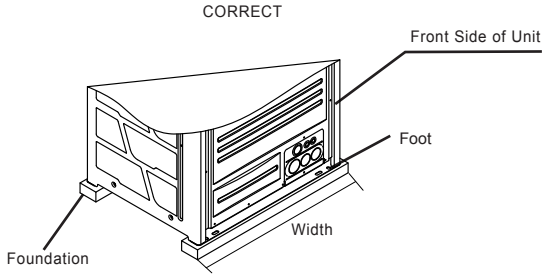
(1) The height of the foundation should be 150mm higher than the ground level.

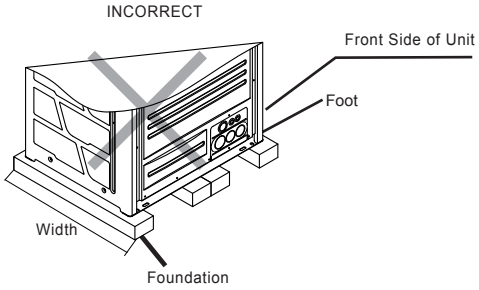
(2) Install a drainage around foundation for smooth draining.



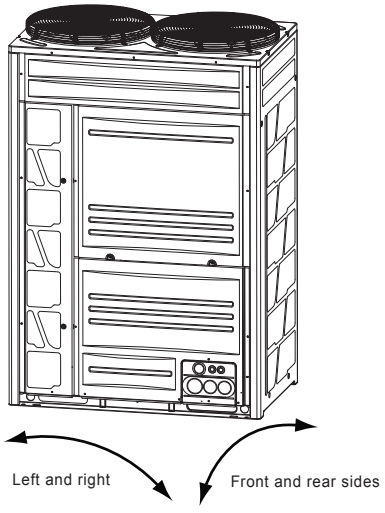
*Provide concrete foundation as shown in the figure.

*Do not provide concrete foundation as shown below. The foot of the outdoor unit may be deformed.





(3) Install the outdoor unit in the front-rear and right-left direction horizontally. (Use a level gauge.) Check to ensure that the gradient in four directions (front, rear, right and left) is within 10mm.



(4) Provide a strong and correct foundation so that:

a. the outdoor unit is not on an incline.

b. abnormal sound does not occur.

c. the outdoor unit will not fall down due to a strong wind or earthquake.

(5) When installing the outdoor unit, fix the unit by anchor bolts (field-supplied).

3.5 Drain Water Treatment

Drain water is discharged during heating and defrosting operation, so does rain water.
Pay attention to the followings:
(1) Choose a place where well drainage is available, or provide a drain ditch.

(2) Do not install the unit over the walkways. Condensation water may fall on people. In case of installing the unit in such a place, provide the additional drain pan.

(3) When drain piping is necessary for the outdoor unit, use the drain boss set (Optional, DC-01Q).
Do not use drain boss and drain pan kit in the cold area. The drain water in the drain pipe may be frozen and then the drain pipe may crack.

(4) When installing the unit on a roof or a veranda, drain water sometimes turns to ice on a cold morning. Therefore, avoid draining into an area where people often use because it is slippery.

4. Refrigerant Piping Work

⚠ DANGER

●Use refrigerant R410A in the refrigeration cycle.
Do not charge oxygen, acetylene or other flammable and poisonous gases into the refrigeration cycle when performing a leakage test or an air-tight test. These types of gases are extremely dangerous and can cause an explosion. It is recommended that compressed air, nitrogen be used for these types of tests.
●Check to ensure that no pressure exists inside the stop valve before removing the flange

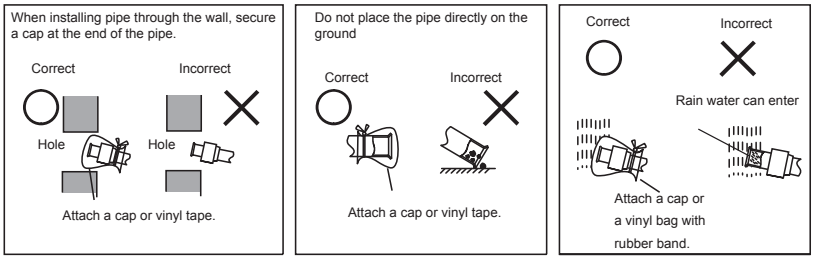
⚠ CAUTION

Ensure to connect the piping among the units in the same refrigeration cycle.

4.1 Piping Materials

(1) Prepare locally-supplied copper pipes.
(2) Select the piping size from 1.4.1 and 1.4.2 in DESIGN chapter.
(3) Select clean copper pipes. Make sure there is no dust and moisture inside of the pipes. Purge nitrogen or dry air into the pipes to remove any dust or foreign materials before connecting pipes. Do not use any tools which produce a lot of swarf such as a saw or a grinder.

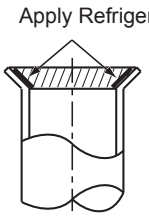
●Cautions for Refrigerant Pipe Ends



●Cautions for Piping Connection Work

(1) Connect the indoor/outdoor units with refrigerant pipes. Fix the pipes and pay attention not to contact with weak materials such as ceiling. (Otherwise, abnormal sound may occur due to the vibration of the piping.)

(2) Apply refrigerant oil slightly on the sheet surface of the pipe and flare nut before the flaring work. And then tighten the flare nut with the specified tightening torque using two spanners. Perform the flaring work on the liquid piping side before the gas piping side. Check the gas leakage after the flaring work

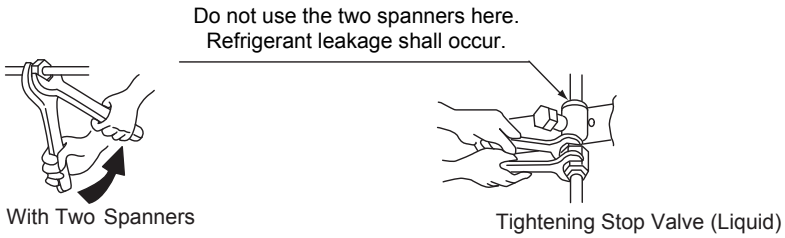


NOTE:
Refrigerant oil is field-supplied.

【Model: FVC68D】

(3) In case that temperature and humidity inside the ceiling exceed 27°C/RH80%, apply additional insulation (approx. 10mm thickness) to the accessory insulation. It prevents dew condensation on the surface of the insulation (refrigerant pipe only).
(4) Perform the air-tight test (4.15MPa for the test pressure).
(5) Perform cold insulation work by insulating and taping the flare connection and reducer connection. Also insulate all the refrigerant pipes.

●When tightening the flare nut, use two spanners.



⚠ WARNING

Do not apply excessive force to the flare nut when tightening. If applied, the flare nut may crack due to aged deterioration and refrigerant leakage may occur. Use the specified tightening torque.

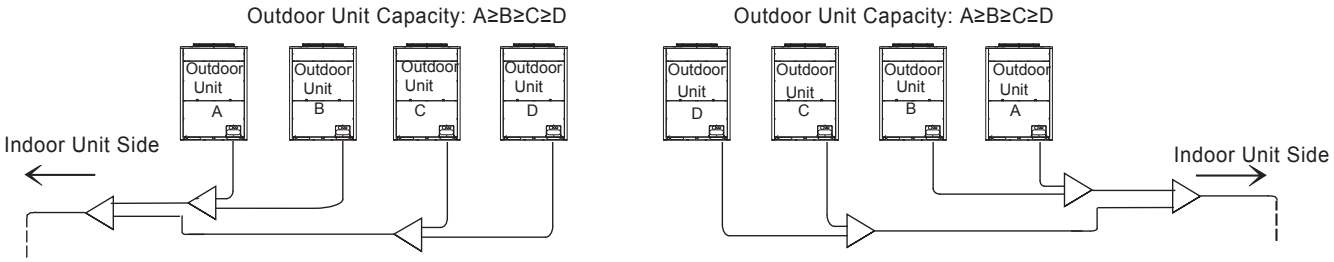
4.3 Caution about Outdoor Unit Installation

Outdoor Unit Alignment

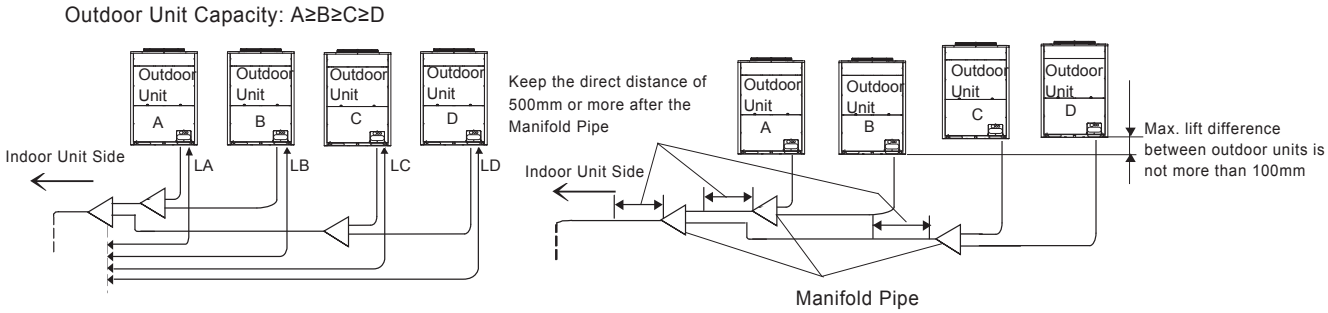
Taking four-module combination of outdoor unit for example.

Align the outdoor unit from large capacity as A>B>C>D, and outdoor Unit "A" should be located at the indoor unit side.



Piping Work between Outdoor Units

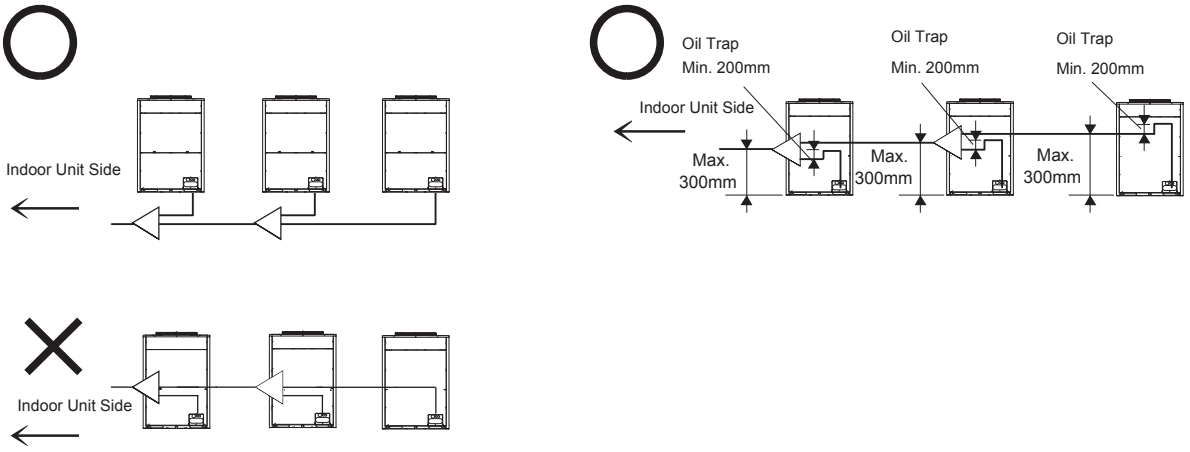
(1) Piping Length between Manifold Pipe (at outdoor unit side) and outdoor unit should be LA<LB<LC<LD<10m.



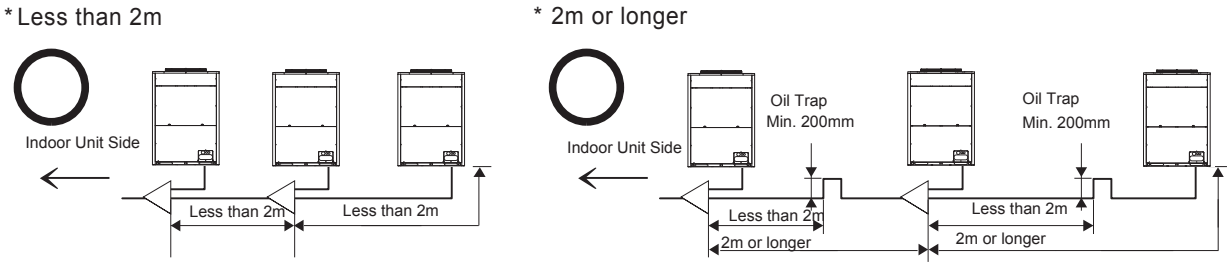
(2) Taking three-module combination of outdoor unit for example.

Place the Manifold Pipe lower than the outdoor unit piping connection.

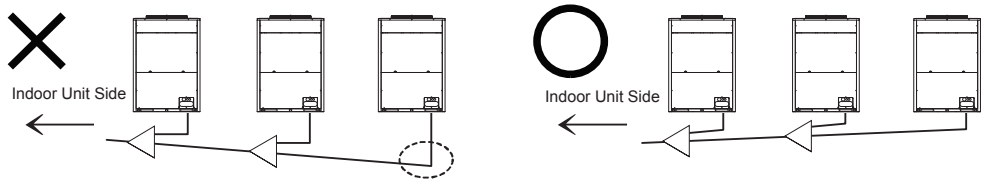
In case that the Manifold Pipe is placed higher than the outdoor unit piping connection, keep 300mm(max.) between the Manifold Pipe and the bottom of the outdoor unit. Also, provide the oil trap(Min.200mm) between the Manifold Pipe and the bottom of the outdoor unit.



(3) In case the piping length between the outdoor is 2m or more, the oil trap should be provided for the gas pipe so that the accumulation of the refrigerant may not occur.

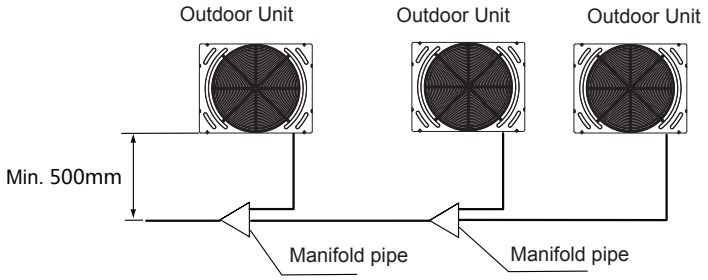


(4) Place the outdoor unit pipe horizontally or with down gradient towards indoor unit side, or refrigerant oil may accumulate in the pipe.



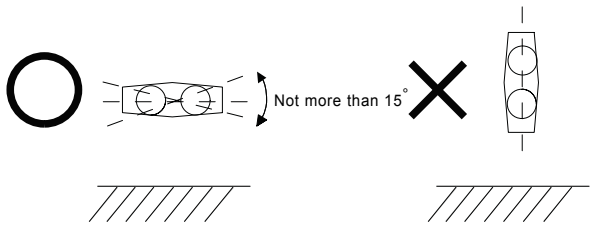
Refrigerant oil accumulates in the pipe

(5) For servicing, in case that the pipe is placed frontward of the outdoor unit, secure min. 500mm between the outdoor unit and the Manifold Pipe. (when the compressor is replaced, a space of min.500mm is required.)



(6) Direction of Manifold Pipe

Place the Manifold Pipe vertically toward the ground (within ±15°) as shown in the figure.



4.4 Piping Connection

Perform the piping connection work for each outdoor unit.

NOTE:

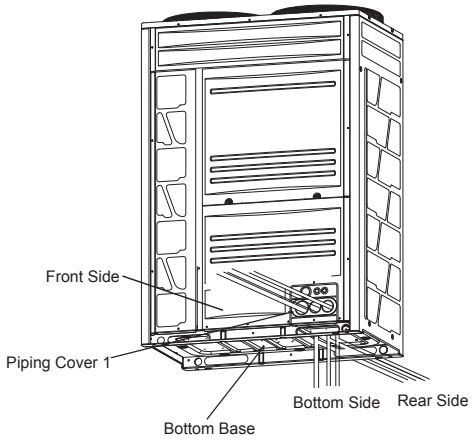
Ensure that the refrigerant pipe should be connected to the same refrigeration cycle unit.

- Prepare the refrigerant pipe in the field for the piping work.
- Piping Direction

  Fix the pipes adequately in order to avoid vibration and excessive force to the valve

(1) The pipes are available to connect in three directions from the bottom base.

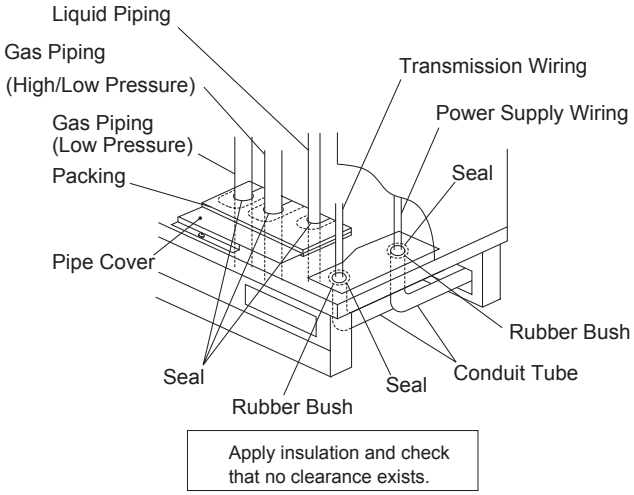
* Front side: gash the piping cover 1 with a boxcutter and connect directly through the service cover at the front unit
* Bottom side: connect directly from the piping cover 2 on the bottom base
* Rear side: connect from the piping cover 2 on the bottom base, then pass through the bottom base to open a hole and connect



(2) Operation of the stop valve should be performed according to Item 4.4.1.

(3) If the piping connected from the front side, completely seal the connecting piping with insulation pipe in order to prevent water or snow from entering the conduit.

(4) If the piping connected from the bottom or rear side, completely seal the penetration part of the bottom pipe with insulation pipe in order to prevent water or snow from entering the conduit.



4.4.1 Stop Valve

<Gas Valve>

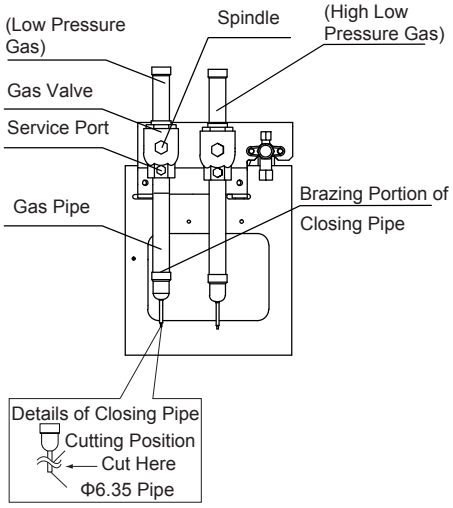
(1) Make sure that the all the stop valves are closed completely;

(2) Connect the charging hose to the service port and release gas from the gas pipe;

(3) Cut the end of the closing pipe (Φ6.35) and check that no gas exists inside the gas pipe;

(4) Remove the stop valve cover;

(5) Remove the closing pipe from the brazing portion by using a burner. Pay attention to the flame from the burner not to burn the stop valve body.



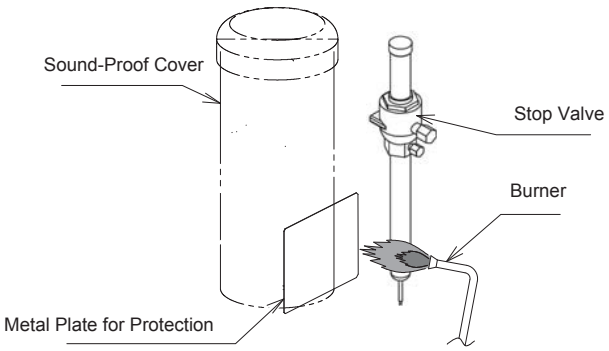


Fig.4.1

⚠ CAUTION

- **Ensure that there is no gas inside the pipe when removing the closing pipe. Otherwise, the pipe may be blown out and it may lead to injury.**
- **Protect the return oil pipe and sound-proof cover of the compressor with the metal plate when using a burner.**

- Stop valve is detailed below:

Model	Torque a(N.m)	Torque b(N.m)
76~96	7	25
114~136	10	30
154~212	13	35

⚠ CAUTION

- **Do not apply an abnormal big force to the spindle valve at the end of opening, otherwise the stop valve will be damaged.**
- **At the test run, fully open the spindle. If not fully opened, the devices will be damaged.**

4.4.2 Piping Connection

(1) Make sure that the stop valves are closed completely.
(2) Protect the compressor and sound-proof cover with metal plate when brazing the gas pipe as shown in Fig. 4.1. Pay attention to the flame from the burner not to burn the stop valve body.
(3) Connect the indoor unit and the outdoor unit with refrigerant piping. Prevent the refrigerant piping from touching weak parts of the building such as wall, ceiling, etc. (Abnormal sound may occur due to the vibration of the piping.)
(4) As for the flaring work of the field pipe, use the specified tightening torque in Table 4.2 Put nitrogen gas into the pipe when brazing.
(5) Insulate the gas pipe and liquid pipe completely.
(6) Mount the piping cover equipped with the outdoor unit after the piping connection. If not, the unit may be damaged due to entering snow or rain water

5. Electrical Wiring

WARNING

●Turn OFF the main power switch to the indoor unit and the outdoor unit and wait for more than 3 minutes before electrical wiring work or a periodical check is performed.

●Check to ensure that the indoor fan and the outdoor fan have stopped before electrical wiring work or a periodical check is performed.

●Protect the wires, electrical parts, etc. from rats or other small animals. If not protected, rats may gnaw at unprotected parts and which may lead to a fire.

●Avoid the wirings from touching the refrigerant pipes, plate edges and electrical parts inside the unit. If not do, the wires will be damaged and at the worst, a fire will occur.

●Use a medium sensing speed type ELB (Earth Leakage Breaker, activation speed of 0.1 sec. or less). If not used, it will cause an electric shock or a fire.

●Fix the cables securely. External forces on the terminals could lead to a fire.

●It is forbidden to use the terminal block of air conditioner power supply to connect the power cable. Use the power distribution box to extend the power supply wiring on the inner side of the air conditioner. Pay attention to the wiring capacity calculation, otherwise, the wiring capacity is too small and the fire may be easily caused.

●Tighten screws according to the following torque.

M4：1.0～1.3 N．m
M5：2.0～2.4 N．m
M6：4.0～5.0 N．m
M8：9.0～11.0 N．m
M10：18.0～23.0 N．m

5.1 General Check

(1) Make sure that the field-selected electrical components (main power switches, fuse, wires, conduit connectors and wire terminals) comply with National Electrical Code (NEC).

●Supply electrical power to each outdoor unit. An ELB, fuse and main switch should be used for each outdoor unit. If not, it will be cause of fire or electric shock.

●The power supply for the indoor unit and outdoor unit should be provided separately.
Connect a power supply wiring to each indoor unit group to be connected to the same outdoor unit.

(2) Check to ensure that the power supply voltage is within ±10% of the rated voltage. If the power supply voltage is too low, the system cannot be started due to the voltage drop.

(3) Check the size of the electrical wires.

(4) In some cases, the air conditioner may not be operated normally under the following cases.

●In case that the air conditioner is supplied with the same power transformer as the device with high electricity consumption*

●In case that the power source wires for the device* and the air conditioner are located close to each other.

(Device*: Lift, container crane, rectifier for electric railway, inverter power device, arc furnace, electric furnace, large-sized induction motor and large-sized switch.) For the cases mentioned above, induction surge of the power supply wiring for the packaged air conditioner may occur due to a rapid change in electricity consumption of the device and an activation of switch. Therefore check the field regulations and standards before performing electrical work in order to protect the power supply wiring for the packaged air conditioner.

(5) Check to ensure that the earth wire of the outdoor unit is connected.

5.2 Electrical Data

⚠ WARNING

The ELB (earth leakage breaker), FUSE and S (main switch) must be installed to the each power source of outdoor unit. If not, it may cause an electric shock or fire.

NOTE:

Supply the power source of outdoor units and indoor units respectively.

(1) Power Source Wiring
Supply the power sources to the each outdoor unit respectively. Power source wiring is fundamentally according to this method.

(2) The recommended wiring, ELB, switching capacity are shown as Table 5.1

NOTE:

(1) Follow local codes and regulations when selecting field wires.

(2) The wire sizes marked with *1 in the above table are selected at the maximum current of the unit according to the European Standard, EN60335-1. Use the wires which are not lighter than the ordinary polychloroprene sheathed flexible cord (code designation H05RN-F).

(3) Use a shielded cable for the transmitting circuit and connect it to ground.

(4) In the case that power cables are connected in series, add each unit maximum current and select wires below

Table 5.2 Power Wire Selection Basis

Current (A)	Wire Size (mm^2)
i≤6	2.5
6<i≤10	2.5
10<i≤16	2.5
16<i≤25	4
25<i≤32	6
32<i≤40	10
40<i≤63	16
63<i	※1

※1 In the case that current exceeds 63A, do not connect cables in series.

⚠ CAUTION

Install a multi-pole main switch with a space of 3.5mm or more between each phase.

NOTE:

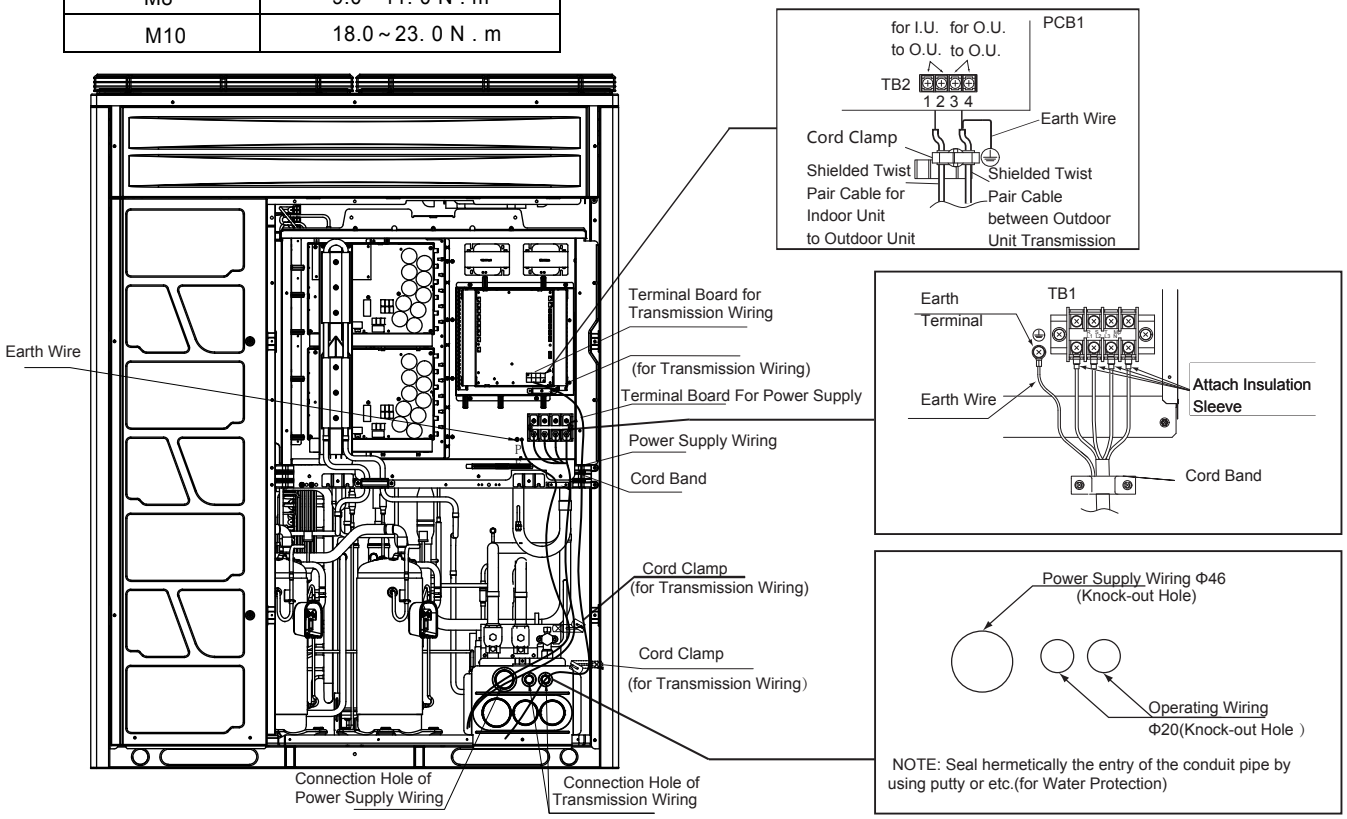
1) When the power supply wiring is longer, select the minimum wiring size of which the voltage drop is within 2%.
2) Power supply voltage should be satisfied with the followings:
   Supply Voltage: Rated Voltage within +10%
   Starting Voltage: Rated Voltage within -15%
   Operating Voltage: Rated Voltage within +10%
   Imbalance between Phases: within 3%
3) Do not connect the earth wire to the gas pipe, water pipe, lightening conductor.
   Gas Pipe: An explosion and ignition may occur when gas leaks.
   Water Pipe: There is no effect of earth wire when a hard vinyl pipe is used.
   Lightening Conductor: The earth electric potential abnormally increases when a lightening conductor is used.

5.3 Electrical Wiring Connection

Connect the electrical wirings according to the following figure.

(1) Connect the power supply wires to L1, L2, L3, and N (for 380-415V) for the three phase power source on the terminal board TB1 and earth wire to the terminal in the electrical control box.
(2) Connect the transmission wires between the outdoor and indoor units to the TB2 terminals 1 and 2 on the PCB1. As for the transmission wires between outdoor units in the same refrigeration cycle, connect them to the TB2 terminals 3 and 4 on the PCB1.
(3) Tighten screws for the terminal board according to the following table.

Size	Tightening Torque
M4	1.0 ~ 1. 3 N . m
M5	2.0 ~ 2. 4 N . m
M6	4.0 ~ 5. 0 N . m
M8	9.0 ~ 11. 0 N . m
M10	18.0 ~ 23. 0 N . m



⚠ CAUTION

Pay attention to the followings to run through the cables under the unit using conduit tube. (The pipe cover is required to remove before performing piping and wiring works.)

NOTE:

1. Do not lead the power supply wiring and transmission wiring through the same conduit tube. Moreover, keep at least 5cm between the power supply wiring and transmission wiring
2. Cut cross line at rubber bush and securely attach it to the knock-out hole for cable protecting.
3. Attach the pipe cover to avoid entrance of rats or other small animals into the unit.
4. Avoid the wirings from touching the refrigerant pipes, plate edges and electrical parts inside the unit.
5. Completely seal the end of conduit tube with sealing materials to avoid entrance rain into the conduit tube. Make a drain hole at the lowest part of the conduit tube.

⚠ CAUTION

Tightly secure the power source wiring using the cord clamp inside the unit.

Electrical Wiring Connection of The System

(1) Connect a power supply wiring to each outdoor unit. Connect an ELB, fuse and main switch (S) to each outdoor unit.
(2) Connect a power supply wiring to each indoor unit group to be connected to the same outdoor unit. Connect an ELB, fuse and main switch (S) to each indoor unit group.
(3) Connect the transmission wiring between indoor units and outdoor units, as shown in figure below.
(4) Connect the transmission wiring in the same refrigeration cycle unit. (In case that the refrigerant pipe of indoor unit is connected to the outdoor unit, connect the transmission wiring to the same indoor unit.) Connecting the refrigerant pipe and transmission wiring to the different refrigeration cycle systems may lead to malfunction.
(5) Use 2-Core lead wires such as shielded twist pair cable for the transmission wiring. (Do not use 3-Core or over.)
(6) Use the same kind of cables for the Hi-NET system of the same refrigeration cycle.
(7) The transmission wiring is required to be separated from the power supply wiring. Keep at least 5cm between the transmission wiring and the power supply wiring, and also min. 1.5m between the transmission wiring and power supply wiring for other electrical device. If the above is not secured, put the power supply wiring into the metal conduit tube to separate from other wirings.
(8) Connect the following transmission wiring to the terminals 1 and 2 of TB2 in the outdoor unit A (main unit).

- between outdoor unit and indoor unit
- between outdoor unit and indoor unit in other refrigerant cycles

(9) Do not connect the power supply wiring to the terminal board for transmission wiring (TB2). Printed circuit board may be damaged.
(10) Connect the earth wire for the outdoor/indoor. The earth wiring work under the condition of 100 ohms (max.) ground resistance should be performed by the qualified person.

NOTE:

1. For the combination units (290 ~ 1088kBtu/h), DSW settings of Main and Sub are required.
2. Alarm occurs if the transmission wires between outdoor units are connected to the terminals 1 and 2 for Hi-NET.
3. In case that alarm is indicated on the LCD of Main outdoor unit, follow the "7-segment" indication of the Main outdoor unit checking.
4. Perform function setting from Main outdoor unit.

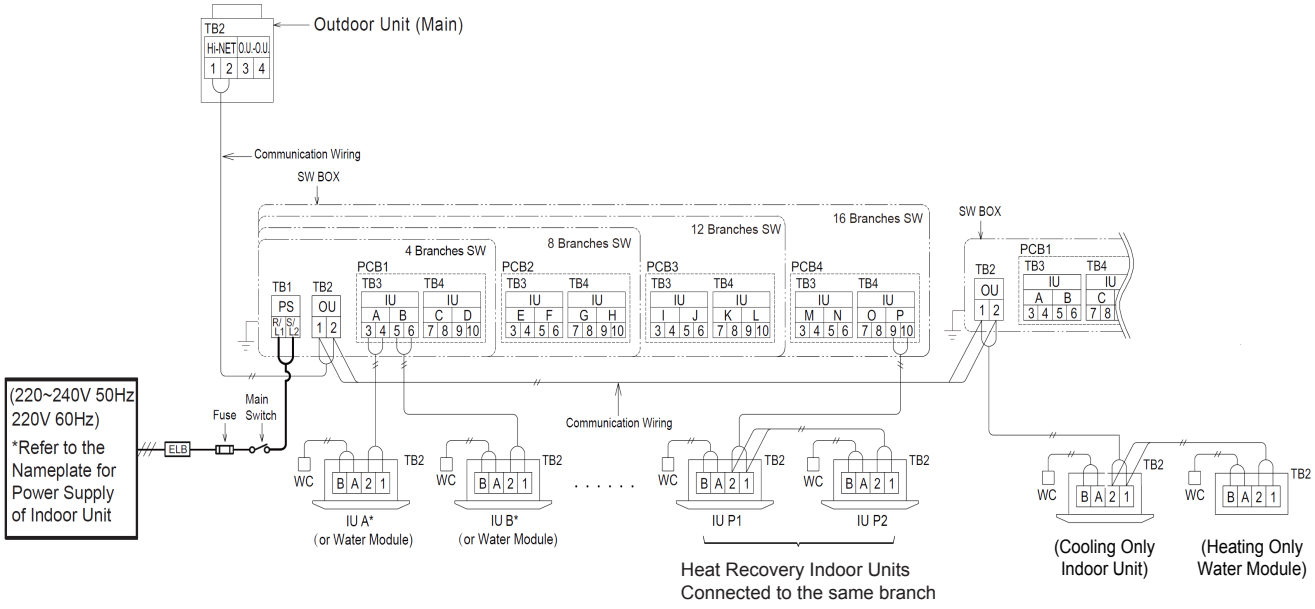
For Multi Branch SW BOX



NOTE:

- When multiple indoor units are connected to the same single SW BOX, they are controlled with the same operation mode.
- When multiple indoor units are connected to the same branch of the multi SW BOX, they are controlled with the same operation mode.
- Do not apply excessive voltage to the communication cable DC5V (non-polarity) between the outdoor unit and the SW BOX, between the SW BOX and the indoor unit or between SW BOXES.
- Use 2-Conductor shielded communication cable for the communication cable. (Do not use 3-Conductor cable or over.)
- Connect the communication cable for the outdoor unit to terminals “1” and “2” on TB2 in the SW BOX.
- Connect the communication cable for the cooling only indoor unit or heating only water module to the terminal “1” and “2” on TB2 in the SW BOX.
- For a SW BOX in the same refrigeration cycle, an electrical power supply can be supplied by one main switch.
- Do not connect the power supply line to the terminal block for transmission line.
- Connect the ground wiring for the outdoor/indoor units and SW BOX. When ground resistance is less than 100 ohms, ground wiring work should be performed by the qualified electrician.
- Do not run the communication cables along with power supply wirings in the SW BOX. Separate communication cables from the power supply wirings.
- Water module should be connected to an exclusive branch of the SW BOX.

5.4 Dip Switch Setting of Outdoor Unit

Without turning OFF, the switches do not work and the contents of the setting are invalid. However, DSW4-No.1, 2, 4 can be operated during power source is ON. The mark of “I” indicates the position of dip switches.

NOTE

- **By using switch DSW4, the unit is started or stopped after 10 to 20 seconds after the switch is operated.**
- **Number this outdoor unit to distinguish from other outdoor units for service and maintenance. And write the number in the space right.**

6. Additional Refrigerant Charge

6.1 Air-Tight Test

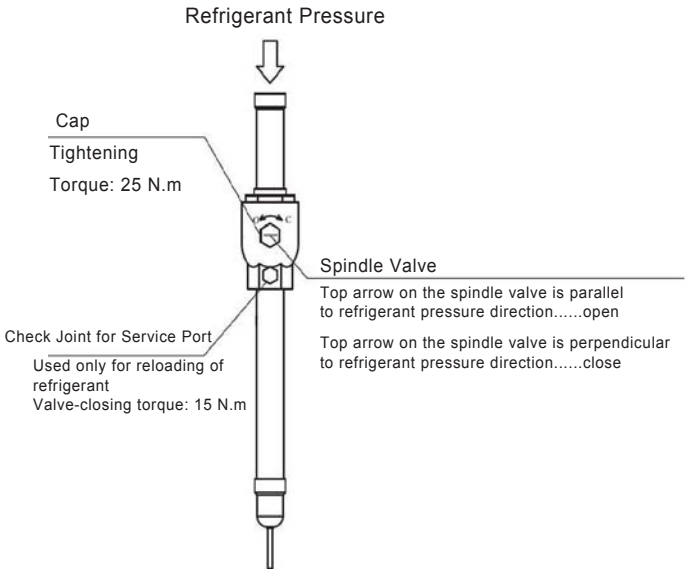
(1)Check to ensure that the stop valves are closed completely before air-tight test.

<Tightening Check of Stop Valves>

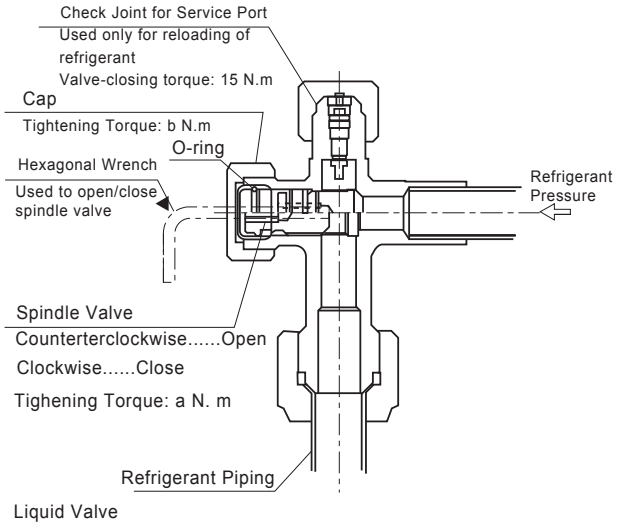
After connecting the pipe, remove the cap of stop valve for liquid.

Do not connect the low-pressure pipe, high/low pressure pipe and relevant stop valve at first. Seal the low-pressure pipe and high/low pressure pipe with sealing cap prepared on the field.

<Gas Valve>



<Liquid Valve>



Liquid Valve

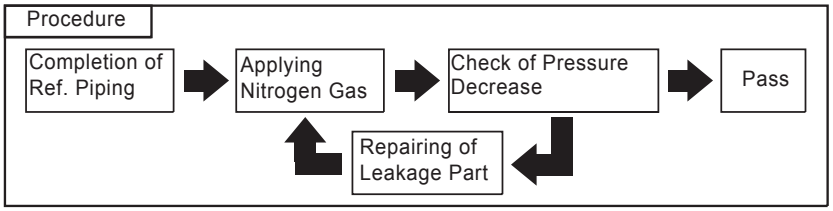
Model	Torque a (N.m)	Torque b (N.m)
76~96	7	25
114~136	10	30
154~212	13	35

(2) Connect the indoor units and the outdoor unit with field-supplied refrigerant piping.
Suspend the refrigerant piping at specified points and prevent the refrigerant piping from touching weak parts of the building such as wall, ceiling, etc. (Abnormal sound may occur due to the vibration of the piping. Pay special attention in case of short piping length.)
(3) Connect the gauge manifold to a vacuum pump or a nitrogen cylinder and the check join of the liuqid stop valves with charging hoses.
(4) Apply nitrogen gas pressure of 4.15MPa.
Do not open the stop valves.

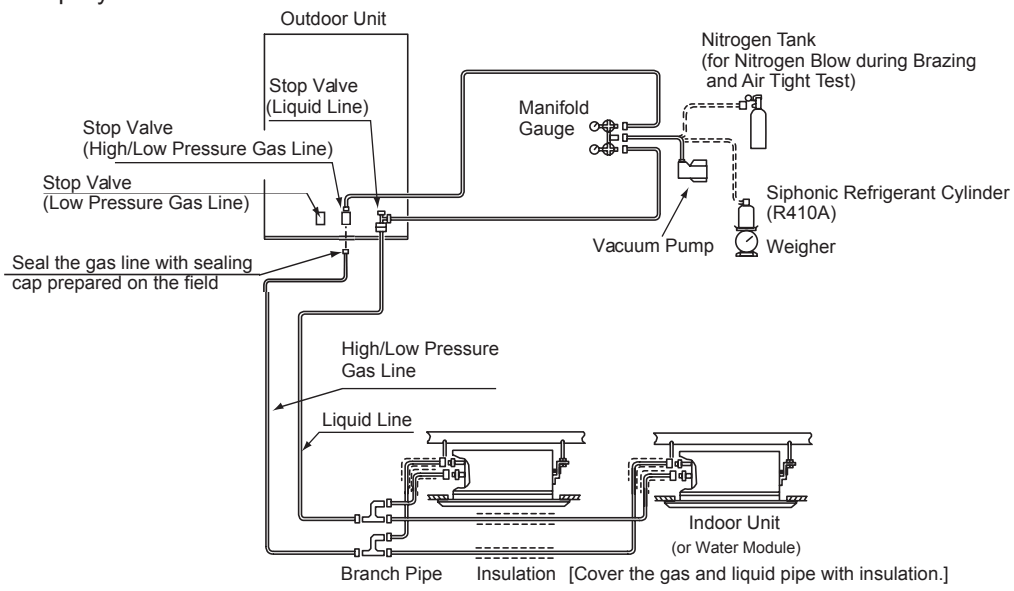
⚠ DANGER

Be sure to use Nitrogen Gas for air-tight test. If other gases such as oxygen gas, acetylene gas or fluorocarbon gas are accidentally used, it may cause explosion or gas intoxication.

(5) Check for any gas leakage at the flare nut connections, or brazed parts by gas leakage tester or by use of a foaming agent or gas leak detector.
(6) After the air-tight test, release the nitrogen, remove the gas pipe sealing cap, then braze the gas pipe with the gas valve.
(7) Mount the piping insulation materials after connecting the pipe.



< Heat Pump System >



< Heat Recovery System >

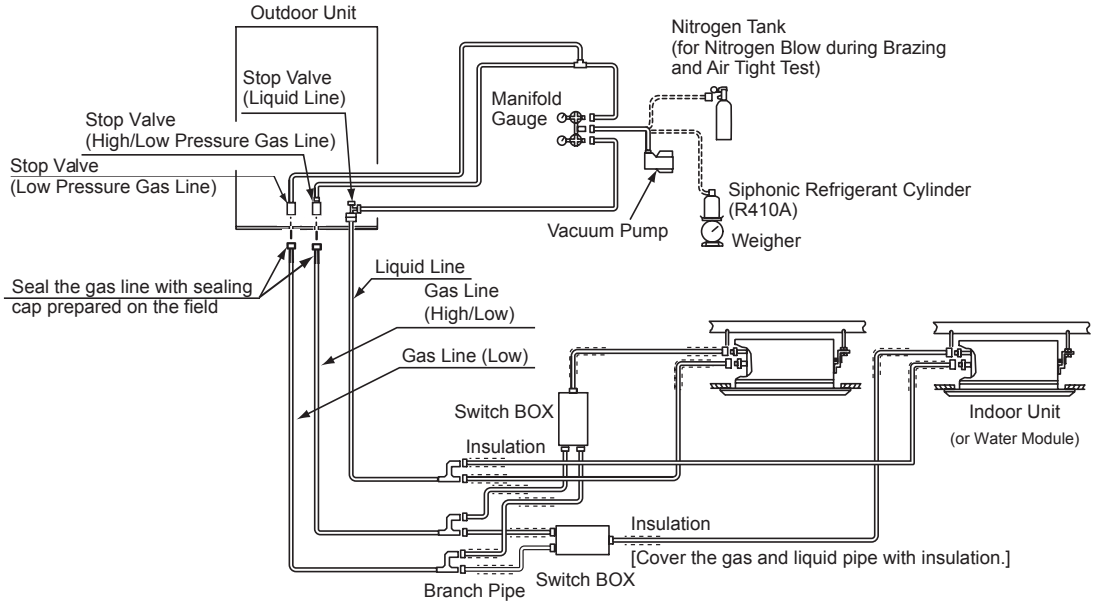


Fig. 6.1 Air-Tight Test

⚠ CAUTION

- **The gas valve must be isolated and protected, and direct pressure on gas valve is absolutely forbidden (see Fig. 6.1)**
- **It is necessary to confirm that the electronic expansion valve of the indoor unit is open and ensure that the piping and indoor unit are connected.**
- **The air-tight test is not available for brazing point between low pressure gas valve, high/low pressure gas valve and gas pipe, confirm whether there is any leakage, and be cautious in brazing operation and pay attention to brazing joint quality.**

6.2 Vacuuming

(1) Connect control valve and vacuum pump to the check joints.
(2) Continue vacuum pumping work until the pressure reaches -0.1MPa (-756mmHg) or lower for one to two hours. After vacuum pumping work, stop the valve of manifold gauge, stop the vacuum pump and leave it for one hour. Check to ensure that the pressure in the manifold gauge does not increase.
(3) Tighten the cap of check joint after the vacuum pumping work.

NOTE:

1. If tools or measuring instruments come into contact with the refrigerant, use the tools or the measuring instruments exclusive for R410A.
2. If vacuum degree of -0.1MPa (-756mmHg) is not available, it is considered that there is a gas leakage. Check for any gas leakage once again. If no leakage exists, operate the vacuum pump for one to two hours.

⚠ CAUTION

- **Insulate the refrigerant pipes as shown in Fig.6.2. After connecting the refrigerant piping, seal the refrigerant pipes by using the field-supplied insulation material. Insulate the unions and flare nuts at the piping connections completely. Insulate the liquid piping and gas piping completely to avoid decreasing of performance and dewing on the surface of the pipe.**

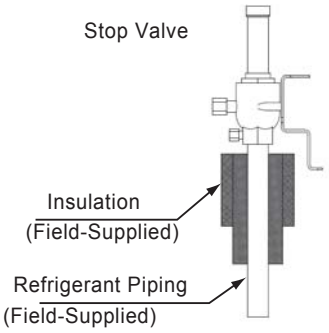

Fig. 6.2 Insulation on Pipes

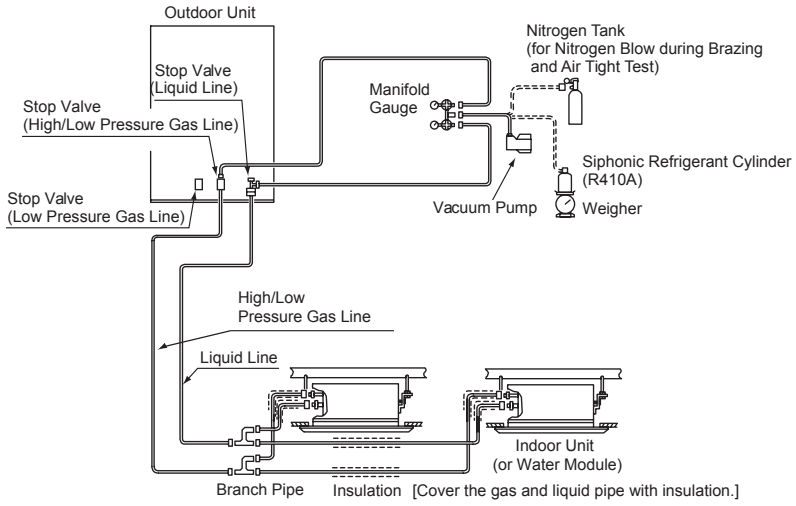
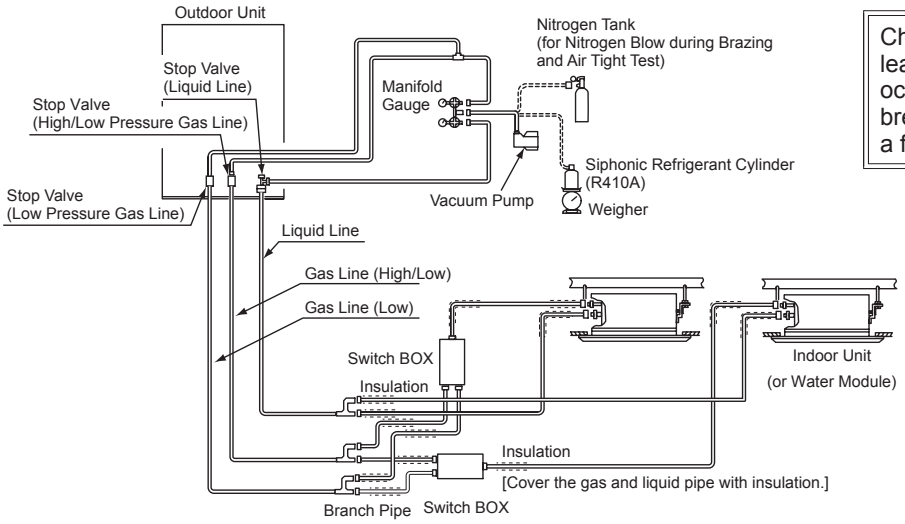
6.3 Charging Work

After vacuum pumping work, check that the gas and liquid stop valve is fully closed.
Charge the additional refrigerant from the check joint of liquid stop valve (Charging Refrigerant Amount Tolerance: 0.5kg). If the specified refrigerant quantity can not be charged, follow the procedure below.

(1) Fully open the stop valve for gas side (In case of heat recovery system, fully open the stop valve for high/low pressure and low pressure gas).
(2) Operate the compressor at the cooling mode and add the refrigerant from the check joint of the liquid stop valve. At this time, the liquid stop valve is slightly opened (Charging Refrigerant Amount Tolerance: 0.5kg).
(3) After refrigerant charging, fully open the stop valve for both liquid and gas sides.
< Heat Pump System >



< Heat Recovery System >



Charge the correct refrigerant quantity . If not, a compressor may be damaged due to an excess or insufficient refrigerant charge.

Refrigerant charge from check joint of gas stop valve may lead to compressor failure. Be sure to charge refrigerant from the check joint of liquid stop valve.

Insulate the liquid piping and gas piping completely to avoid decreasing of performance and dewing on the surface of the pipe.

Insulate the flare nut and union of the piping connection with insulation.

Check to ensure that there is no gas leakage. If a large refrigerant leakage occurs, it will cause difficulty wit breathing or harmful gases would occur if a fire was being used in the room

- Special Attention Regarding Refrigerant Gas Leakage

Pay attention to the critical gas concentration to avoid accidental refrigerant gas leakage beforeinstalling air conditioning systems.

$$\frac{\text{Totally Charged Refrigerant Quantity in System}}{\text{Room Space for each Indoor Unit } (m^3)} \leq \text{Critical Concentration } (kg/m^3)$$

↑

$0.3kg/m^3$

* In case of KHK S 0010 (High Pressure Gas Safety Institute of Japan), this value should be decided according to the each country's regulation such as ISO5149 and EN378. In the case that the calculated critical concentration is higher than 0.3kg/m^3, take the following actions:

1) Provide a gas leakage detector and exhaust fan(s) controlled by its gas leakage detector.

2) Provide each effective opening at the wall or door for ventilation to next door so that the critical gas concentration can be maintained lower than the above value. (Provide an opening more than 0.15% of floor surface at the lower part of a door.)

⚠ CAUTION

1. **Maximum Permissible Concentration of HFC GAS R410A**
   The refrigerant R410A is an incombustible and non-toxic gas. However, if leakage occurs and gas fills a room, it may cause suffocation.
   The maximum permissible concentration of HFC gas, R410A in air is 0.3kg/m^3, according to the refrigeration and air conditioning facility standard (KHK S 0010 by the KHK (High Pressure Gas Safety Institute Japan. Therefore, some effective measures must be taken to lower the R410A concentration in air below 0.3kg/m^3, in case of leakage.
2. **Calculation of Refrigerant Concentration**
   (1) Calculate the total quantity of refrigerant R (kg) charged in the system connecting all the indoor units of objective rooms.
   (2) Calculate the room space where this unit is to be installed V (m^3) of each objective room.
   (3) Calculate the refrigerant concentration C (kg/m^3) of the room according to the following equation.

$$\frac{\text{R: Total Quantity of Charged Refrigerant (kg)}}{\text{V: Room Space Where This Unit is to Be Installed } (m^3)} = \text{C: Refrigerant Concentration} \leq 0.3\ (kg/m^3)$$

If local codes or regulations are specified, follow them.
<Example> Japanese Standard KHKS 0010 C=0.3 (kg/m^3)

7. Test Run

Test run should be performed according to the Item 7.2.

⚠ WARNING

- **Do not operate the system until all the check points have been cleared.**

As for the test run of indoor unit and water module, check "Installation & Maintenance Manual" attached to the indoor unit and water module.

7.1 Before Test Run

(1) Check to ensure that the refrigerant piping and transmission between outdoor unit, SW BOX, indoor units or water modules are connected to the same refrigeration cycle. If not, it will cause an abnormal operation and a serious accident. Check that the dip switch setting of the refrigeration cycle number and the unit number for the indoor units and water modules apply to the system. Confirm that the dip switch setting on the printed circuit board of the indoor units, water modules and the outdoor units are correct. Especially, pay attention to the setting of lift between indoor units and outdoor unit, the refrigerant No. and the end terminal resistance.
(2) Check to ensure that the electrical resistance is more than 1MΩ, by measuring the resistance between ground and the terminal of the electrical parts. If not, do not operate the system until the electric leakage is found and repaired (Refer to "Caution for Insulation Resistance" for details.). Do not impress the voltage on the terminals for transmission.
(3) Check to ensure that each wire, L1, L2, L3 and N is correctly connected at the power source. If incorrectly connected, the unit will not operate and the remote control switch will indicate the alarm code "05". In this case, check and change the phase of the power source according to the attached sheet on the reverse side of the service cover.
(4) Check to ensure that the switch on the main power source has been ON for more than 4 hours, to warm the compressor oil by the oil heater. When powered, the outdoor units will not operate (Stoppage Code d1-22) immediately if it is in protection status due to low compressor oil temperature. In case of operating within 2 hours, release the protection control as follows:

1. Supply power to the outdoor unit.
2. Wait for 30 seconds
3. Push PSW5 on the outdoor PCB more than 3 seconds in order to release the d1-22.
4. In case of using remote control switch for release, push "Air Flow" and "Auto Louver" switch simultaneously for 3 seconds.

(5) Main Unit Label

In case of the combination of base units, attach the main unit label on a visible spot of the main unit (outdoor unit A), so that the outdoor unit A can be identified easily . Do not attach the main label on the sub unit (outdoor unit B, C and D).

(6) Water circuit check before test run (In case of the water module is utilized in the system)

(A) Before the test run, please check again if all the water pipe construction is in the proper state.
(B) Inject water into the water module and make sure that the plate type heat exchanger is filled with cycle water; open the water pump and exhaust valve and make sure that air in the unit and pipeline is already exhausted.
(C) Force the running of the water pump, read the value on the pressure gauge and confirm the action of the flow switch to check if the water cycle system is properly installed. (Refer to installation manual of water module)
(D) After the initial test run, please clean the water filter and make sure that the filter mesh is clean and free of impurities.

⚠ CAUTION

Caution for Insulation Resistance:
If total unit insulation resistance is lower than 1MΩ, the compressor insulation resistance may be low due to retained refrigerant in the compressor. This may occur if the unit has not been used for long periods.

1. **Disconnect the cables to the compressor and measure the insulation resistance of the compressor itself. If the resistance value is over 1MΩ, then insulation failure has occurred for other electrical parts.**
2. **If the insulation resistance is less than 1MΩ , disconnect the compressor cable from the inverter PCB. Then, turn on the main power to apply current to the crankcase heater. After applying current for more than 3 hours, measure insulation resistance again. (Depending on the air conditions, pipe length or refrigerant conditions, it may be necessary to apply the current for a longer period of time). Check the insulation resistance and reconnect the compressor.**
   If the leakage breaker is activated, check the recommended size shown in Table 5.1.

⚠ CAUTION

1. **Confirm that field-supplied electrical components (main switch fuse, fuse-free breaker, earth leakage breakers, wires, conduit connectors and wire terminals) have been properly selected according to the nominal electrical data and ensure that the components comply with national and local codes.**
2. **Use shielded wires (>0.75mm^2) for field wiring to protect electrically noise obstacle. (total length of shielded wire shall be less then 1000m, and size of shielded wire shall comply with local codes.)**
3. **("N" to "N" of each terminal board is 380-415V) is correct. If not, some component will be damaged. Check to ensure that the terminal for power source wiring (the voltage of terminals "L1" to "L1" and of shielded wire shall comply with local codes.)**

7.2 Test Run

(1) Check to ensure that the stop valves of the outdoor unit are fully opened and then start the system.
(In case of the combination of base units, check that the stop valves of all the connected outdoor units are fully opened.)
NOTE: Low pressure gas is used for heat recovery system only.
(2) Perform the test run of indoor units one by one sequentially and then check accordance of the refrigerant piping system and electrical wiring system. (If the multiple indoor units are operated simultaneously, the system can not be checked for the system accordance.)
(3) Perform the test run according to the following procedure. Ensure that the test run is carried out without any problem.

NOTE: In case of 2-remote control switch (main and sub), firstly perform the test run of the main remote control switch.

a) Set the "TEST RUN" mode by pressing the "MODE" and "CHECK" switch of controller simultaneously for at least 3 seconds.

→ "TEST RUN" is displayed on the LCD.
The total number of the indoor units connected is indicated on the LCD.

05 unit ← Example when 5 indoor units are connected.

- Regarding other optional remote control switch (wireless remote control or half-size remote control), follow "Installation & Maintenance Manual" attached to each optional remote control switch and perform the test run.
- In case that the multiple indoor units are operated simultaneously controlled by one remote control switch, check the connected number of indoor unit is indicated on LCD.
  In case that the indicated number is not correct, the auto-address function is not performed correctly due to incorrect wiring, the electric noise or etc. Turn OFF the power supply and correct the wiring after checking the following points; (Do not repeat turning ON and OFF within 10 seconds.)
  * Power Supply for Indoor Unit is Not Turned ON or Incorrect Wiring.
  * Incorrect Connection of Connecting Cable between Indoor Units or Incorrect Connection of Controller Cable
  * Incorrect Setting of Rotary Switch and Dip Switch (The setting is overlapped.) on the Indoor Units PCB.

b) Set the operation mode by pressing "MODE" switch.

c) Press "RUN/STOP" switch.

→ The operation lamp will be turned ON before the test run starts.
2-hour OFF Timer will be set automatically, and "OFF Timer" and "2HR" will be indicated LCD. Although the air flow initial setting is "HI", the setting can be changed.

- Check the operation range according to page I.

  * Do not touch any of the parts by hand at the discharge gas side, since the compressor chamber and the pipes at the discharge side are heated higher than 90°C.
  * DO NOT PUSH THE BUTTON OF THE MAGNETIC SWITCH(ES). It will cause a serious accident.
  * Do not touch any electrical components for at least 3 minutes after turning OFF the main switch.
  * Check that the refrigerant piping setting and electrical wiring setting are for the same system, by operating the indoor unit one by one.

d) Depress "AUTO LOUVER" switch and check that the louver is activated normally without abnormal sound. Depress "AUTO LOUVER" again so that the louver will stop. If abnormal sound is heard, remove the panel and adjust the fitting condition of connection parts in the panel corner cove. Ensure that the panel is mounted correctly to the unit body, otherwise the panel may be deformed.
e) The temperature control will be invalid though the protection device will be activated during the test run. If alarm occurs, find out the cause of abnormality according to Alarm Code in MAINTENANCE AND SERVICE chapter. And again perform the test run after solving the problems.
f) According to the label "Checking of Outdoor Unit by 7-segment Display on PCB1" attached to the rear side of the front cover of the outdoor unit, inspect temperature, pressure, operation frequency, and connected indoor unit numbers by the 7-segment displays.
g) To end the test run, wait for 2 hours or push "RUN/STOP" switch again.
